Assignment Project Exam Help

EXAM CODES:

FIT1008

TITLE OF PAPER:

Introduction to computer science

EXAM DURATION:

3 hours 10 mins

Email: tutorcs@163.com

QQ: 749389476

Rules

During an exam, you must not have in your possession any item/material that has not been authorised for your exam. This includes books, notes, paper, electronic device/s, mobile phone, smart watch/device, calculator, pencil case, or writing on any part of your body. Any authorised items are listed below. Items/materials on your desk, chair, in your clothing or otherwise on your person will be deemed to be in your possession.

No examination materials are to be removed from the room. This includes retaining, copying, memorising or noting down content of exam material for personal use or to share with any other person by any means following your exam.

Failure to comply with the above instructions, or attempting to cheat or cheating in an exam is a discipline offence under Part 7 of the Monash University (Council) Regulations, or a breach of instructions under Part 3 of the Monash University (Academic Board) Regulations.

Authorised Materials

if yes, items permitted are:

Instructions

Please answer all questions.

This exam is worth 60% of your overall mark.

To answer a question that requires a code response use 2 spaces to represent each indentation level. Do not use the Tab key to indent, as this will not indent and instead move you to the next field.

Multiple Choice

Question 1

This question is about hash tables with open addressing.

A hash table of size 10 uses hash function $\text{hash}(\text{key}) = \text{key} \% 10$ and linear probing to handle collisions. After inserting 6 keys into an empty hash table, the corresponding array is as follows: [None, None, 32, 13, 54, 22, 46, 53, None, None]

Which one of the following choices is an ordering in which the key values could have been inserted in the table?

Select one:

- ☐ a. 46, 32, 54, 22, 13, 53
- ☐ b. 54, 32, 13, 22, 53, 46
- ☐ c. 46, 54, 32, 13, 22, 53
- ☐ d. 32, 46, 53, 13, 54, 22
- ☐ e. 53, 46, 22, 54, 13, 32
- ☐ f. None of the above

程序代写代做 CS编程辅导

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

Only c is a possible ordering. For 22 to end up in slot 5, 32, 13 and 54 must already have been inserted. Similarly, for 53 to end up in slot 6, it must have been inserted last.

Question 2

Consider the array representation of **Heap** class as seen in the lectures. Which one of the following arrays does **not** represent a **max heap**.

Select one:

- ☐ a. [None,9,5,6,3,4,1]
- ☐ b. [None,11,9,3,5,6,1]
- ☐ c. [None,8,6,5,3,2,2]
- ☐ d. [None,15,6,10,2,7,8]
- ☐ e. [None,11,7,9,5,6,8]
- ☐ f. None of the above

d is not a valid max-heap. Node 2 (with priority 6) has a child with priority 7, which violates the heap condition

QQ: 749389476

<https://tutorcs.com>

Question 3

This question is about MIPS. Assume you want to translate to MIPS the Python condition

if $x \leq y$:

where both x and y are global variables. Which of the following pieces of MIPS code correctly translates the Python condition? Indicate what each line of the selected code does, or (if none of the above) provide the correct code.

程序代写代做 CS编程辅导

a)

```
lw $t0, x
lw $t1, y
slt $t2, $t0,
$t1 beq $t2, $0, endif
```

b)

```
lw $t0, x
lw $t1, y
slt $t2, $t0, $t1
bneq $t2, $0, endif
```

c)

```
lw $t0, x
lw $t1, y
slt $t2, $t1, $t0
bne $t2, $0, endif
```

d)

```
lw $t0, x
lw $t1, y
slt $t2, $t1, $t0
beq $t2, $0, endif
```

e)

```
slt $t2, x, y
beq $t2, $0, endif
```

f)

```
slt $t2, x, y
bne $t2, $0, endif
```

g)

```
slt $t2, y, x
beq $t2, $0, endif
```

h)

```
slt $t2, y, x
bne $t2, $0, endif
```

i)

None of the above.

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

The correct solution is c. The first two instructions load x into $\$t0$ and y into $\$t1$, respectively. The next instruction tests whether $y < x$, setting $\$t2$ to 1 if true, and 0 if false. The last instruction exists the if then else if $y < x$ is true (i.e., if not $x \leq y$) by checking if $\$t2$ is 1, which means not equal to 0.

Marking guide:

- For a, b, c, and d,
 - o 0.5 for correctly saying what lw does in the first two lines
 - o 0.5 for correctly saying what the slt does
 - o 0.5 for correctly saying what the last instruction does
 - o 1.5 for correctly selecting c

Question 4

This question is about MIPS. The following piece of MIPS code translates the Python array access

```
x = the_list[i-1]
```

where **x**, **the_list** and **i** are all global variables. The code is correct if $i > 0$. This might seem strange, as the MIPS code does not include an instruction to subtract 1 from index **i**. Explain why this is not needed when

(no marks).

```
lw $t0, i
lw $t1, the_list
addi $t2, $0,
4
mult $t0, $t2
mflo $t0
add $t0,
$t0, $t1
lw $t0, ($t0)
sw $t0, x
```

程序代写代做 CS编程辅导

WeChat: cstutorcs

Assignment Project Exam Help

We do not need to subtract 1 from index **i** because the penultimate instruction (`lw $t0, ($t0)`) did not add 4 to the address of the element to jump over the length, that is, it was not the usual `lw $t0, 4($t0)`. Therefore, the code is accessing one element less than **i**. This is only a problem when the index **i** is 0, since then it will be accessing the length of the array. But in such case, the python code should not have been called either.

Email: tutorcs@163.com

QQ: 749389476

Marking guide:

2/2 marks for talking about usually adding 4 to jump over the length of the array (or explicitly mentioning size is first element and skipping size of array)

<https://tutorcs.com>

-0.5 for saying `[address+0]` is the address, and not the size of the list

1/1 mark to point to the instruction that adds the 4 usually

(or explaining the shifting of indices due to no +4 offset (`$t0`) and concluding subtract 1 is not needed for **i**)

Question 5

This question is about sorting. Consider the following piece of code:

```
def some_sort(the_array):
    n = len(the_array)
    for p in range(n):
        tmp = the_array[p]
        q = 0
        while the_array[q] < tmp:
            q += 1
        while q <= p:
            r = the_array[q]
            the_array[q] = tmp
            tmp = r
            q += 1
```

WeChat: cstutorcs

Is this a correct sorting algorithm? If so, explain the invariant that ensures correctness; if not, give an example where it fails.

Assignment Project Exam Help

Yes, it is a correct sorting algorithm. The invariant it maintains is that after each iteration, the first p elements of the list are in sorted order (like insertion sort). The while loop identifies the position where `the_array[p]` should be inserted: everything left of q is strictly less than the item, and everything between q and p is greater than or equal to. Then the second loop shuffles all the elements in range $[p, q)$ one step to the right, inserting the new item into the empty space.

Email: tutormcs@163.com

Marking guide: (8 marks)

- 1 mark for saying it is a sorting algorithm
- 2 marks for correctly identifying the invariant
- 2 marks for explaining how the destination is found
- 3 marks for explaining the insertion

QQ: 749389476

https://tutorcs.com

2 mark for saying it is a sorting algorithm (1.5 if not given, but assume so)

3 marks for correctly identifying the invariant

1 marks for explaining how the destination is found

2 marks for explaining the second while loop (the insertion)

Common issues:

- state that it is not a sorting algorithm
- For those saying YES:
 - do not understand what an invariant is
 - invariant is not complete, fairly vague.
 - fail to explain what the first and second while loops do?

Suggestion:

To ask students to explain each task in the code if saying TRUE

Question 6

Given the following implementation of Quick Sort, implement the partition function choosing the last element of the list as pivot.

程序代写代做 CS编程辅导

```
def quick_sort(array):
    start = 0
    end = len(array) - 1
    quick_sort_aux(array, start, end)

def quick_sort_aux(array, start, end):
    if start < end:
        boundary = partition(array, start, end)
        quick_sort_aux(array, start, boundary - 1)
        quick_sort_aux(array, boundary + 1, end)
```

WeChat: cstutorcs

Assignment Project Exam Help

```
def partition(array, start, end):
    mid = end
    pivot = array[mid]
    array[start], array[mid] = array[mid], array[start]
    index = start

    for k in range(start + 1, end + 1):
        if array[k] < pivot:
            index += 1
            array[k], array[index] = array[index], array[k]

    array[start], array[index] = array[index], array[start]
    return index
```

Email: tutorcs@163.com

QQ: 749389476

https://tutorcs.com

Marking guide (7 marks):

- 1 mark for choosing the correct pivot
- 1 mark for walking over the array, (total 4)
 - +1 for swapping when < pivot
 - +1 for updating index
 - +1 for handling boundary cases
- 1 mark for swapping the pivot into position
- 1 mark for returning pivot index

IF sorting not done in place (MAX 5 marks)

Alternate version (starting from both sides) is also fine; same marking scheme, but with the corresponding condition for swapping.

Not doing in place SWAPS (MAX 5)

- 1/1 correct pivot selection
- 1/1 walking over the array
- 1/1 for handling boundary cases
- 1/1 updating the original array
- 1/1 returning pivot index

Data Structures

Question 7

程序代写代做 CS编程辅导

This question is about Data Structures.

Consider a **List** class implemented using arrays, whose partial implementation is as follows:

```
def __init__(self, size):
    if size <= 0:
        raise ValueError("Size should be positive")
    self.array = [None] * size
    self.count = 0
```

```
def size(self):
    return self.count
```

```
def is_empty(self):
    return self.size() == 0
```

```
def is_full(self):
    return self.size() >= len(self.array)
```

```
def __contains__(self, item):
    for i in range(self.count):
        if self.array[i] == item:
            return True
    return False
```

ALSO OKAY:

```
def __contains__(self, item):
    return item in self.array[:self.count]
```

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutormcs@163.com

QQ: 749389476

<https://tutormcs.com>

Marking guide (4 marks):

- 2 marks for iterating over the array, comparing elements
- 1 mark for correct boundary condition (self.count not len(self.array))
- 1 mark for correct return (returning False at the end, not e.g. inside the loop)

/2 iterating through the array and comparing

-0.5 for not returning from infinite loop

-0.5 for more than 1 indentation error

/1 boundary for using self.count or self.size() (*self.size is ok)

-0.5 for using self.count-1 or self.size()-1

-0.5 for using count and not self.count

-0.5 for using size and not self.size()

/1 return, setting it outside loop

Question 8

Consider a **List** class implemented using arrays, whose partial implementation is as follows:

```
def __init__(self, size):
    if size <= 0:
        raise ValueError("Size should be positive")
```

```
self.array = [None] * size self.count  
= 0
```

```
def size(self):  
    return self.count
```

```
def is_empty(self):  
    return self.count == 0
```

```
def is_full(self):  
    return self.count == len(self.array)
```

Add also to the `List` class an `insert` method

```
remove_first(self)
```

程序代写代做 CS编程辅导

which removes and returns the element at index 0, ensuring all other elements are correctly swapped to the left. You should appropriately account for any errors.

WeChat: cstutorcs

```
def remove_first(self):  
    if self.count == 0:  
        raise IndexError("Cannot remove first from empty list.")  
    item = self.array[0]  
    self.count -= 1  
    for i in range(self.count):  
        self.array[i] = self.array[i+1]  
    return item
```

Assignment Project Exam Help

Email: tutorcs@163.com

Marking guide (7 marks):

- 1 mark for updating count
- 1 mark for returning correct item
- 4 marks for correctly shifting elements to the left (swap is okay)
 - o -1 mark for missing first/last item
- 1 mark for correctly handling empty list

QQ: 749389476

<https://tutorcs.com>

Question 9

The queue consists of items on stack.left (in stack order), followed by items on stack.right in reverse order.

Append pushes items onto the top of the self.right. For serve, if self.left is empty but self.right is not, it pops each element off self.right, and push it onto self.left (reversing the order). In either case, it pops the top off self.left. Less efficient: To serve, we pop the top element from self.left and push it onto self.right. Then we push the new item, and reverse self.right. To serve, we pop the top of self.left where append pushes, and serve does move-pop-move).

程序代写代做 CS编程辅导

Marking guide (6 marks):

- 2 marks for explaining representation (how the queue elements are stored)
- 2 marks for explaining operation of append
 - o -1 for poor explanation, or missing boundary cases
- 2 marks for explaining operations of pop
 - o -1 for poor explanation, or missing boundary cases

WeChat: cstutorcs

QQ: 749389476

<https://tutorcs.com>

程序代写代做 CS编程辅导

D, E, F and any linked list with non negative values are all possible outputs after running mystery. The first loop drops any nodes at the start of the list containing self.head. Then the second loop steps through the remaining nodes, unlinking any containing negative values. Hence, only lists containing non-negative values can be returned.

Alternative answer: Assuming the list is empty before calling mystery function, the correct answer is option F, the list remains empty after calling mystery. Both while and if statement won't be executed since self.head is None.

Marking guide (8 marks):

- 2 marks for identifying one or more correct results
 - -1 mark for identifying one or more correct results but also stating the other correct results as wrong
- 1 mark for talking about negative values (not including zero) as the final results
- 2 marks for talking about dropping initial values (total 3)
 - +1 for talking about updating head
 - -1 for incomplete/unclear explanation
- 2 marks for talking about second loop removing following non negative items
 - -1 mark for incomplete/unclear explanation
- 0 marks for totally wrong explanation even with correct result option.

For alternative answer:

- 8 marks for correct and valid reasoning that no effect to the list because the list is empty
 - -4 marks for incorrect reasoning

<https://tutorcs.com>

Recursion

Question 11

This question is about Recursion.

You are visiting a friend, who has a room number 1008/FIT2085, for the weekend. But when you arrive, your friend is nowhere to be found; and instead of their door

you are given a pair of numbers, and the following clue:

```
def clue(x, y):  
    if y == 0:  
        return 1  
    elif y % 2 == 0:  
        y = clue(x, y//2)  
        return x * y  
    else:  
        y = clue(x, y-1)  
        return x * y
```

WeChat: cstutorcs

You may assume all inputs are **positive integers**.

Write the result of the function `clue` for the input values

Assignment Project Exam Help

`x = 100, y = 1`

Question 15

You are visiting a friend, who has previously completed FIT008/FIT2085 for the weekend. But when you arrive, your friend is nowhere to be found; and instead of their door code, they give you a pair of numbers, and tell you:

```
def clue(x, y):  
    if y == 0:  
        return 1  
    elif y % 2 == 1:  
        y = clue(x, y-1)  
        return x * y  
    else:  
        y = clue(x, y//2)  
        return y * y
```

WeChat: cstutorcs

You may assume all inputs are **positive integers**.

Assignment Project Exam Help

What is the worst-case time complexity of **clue** (using big-O time complexity)? Explain your answer (no explanation, no marks).

Email: tutorcs@163.com

QQ: 749389476

Worst-case complexity of $\text{clue}(x, y)$ is $O(\log(y))$. Complexity of a call body is $O(1)$. At each step, y halves if y is even. If y is odd, it decreases by 1, so y is even in the next iteration.

<https://tutorcs.com>

Marking guide (3 marks):

- 1 mark for $\log(y)$, if an explanation is given
- 1 mark for talking about y being halved
- 1 mark for including the odd case

Binary Search Trees

Question 16

Binary Search Trees 程序代写代做 CS编程辅导 Question 16

This question is about Binary Search Trees.

Complete the missing expressions in the following code for `sum_leq`, which recursively computes the sum of all elements in a BST tree which are less than or equal to `item`.

9
Marks

```
def sum_leq(self, item):  
    return self.sum_leq_aux(self.root, item)  
  
def sum_leq_aux(self, current, item):  
    if current is None:  
        return 0  
    else:  
        low_sum = 0  
        if current.item <= item:  
            return 0  
        elif current.item < item:  
            return low_sum  
        else:  
            return 0
```

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

- 0
- `sum_leq(current.left, item)`
- `low + current.item`
- `item < current.item`
- `low + current.item + sum_leq(current.right, item)`

QQ: 749389476

<https://tutorcs.com>

Marking guide (9 marks):

- 1 mark for 0
- 2 marks for correct recursive call
- 1 mark for correct addition
- 2 marks for correct inequality
- 2 marks for recursive call, +1 for correct additions

Question 17

Question 17

程序代写代做 CS编程辅导

The following method either returns the sum of the items in the tree that are ancestors of the node whose item is value in  or None if value is not present.

```
def sum_parents(node, value):
    if node is None:
        return None
    elif node.item == value:
        return 0
    elif value < node.item:
        below = sum_parents(node.left, value)
    else:
        below = sum_parents(node.right, value)
    if below is None:
        return None
    else:
        return below + node.item
```

WeChat: cstutorcs

Assignment Project Exam Help

What is the worst-case complexity of `sum_parents`? (Remember to define any variables you use). For what kind of trees does this occur?

Email: tutorcs@163.com

$O(n)$, where n is the number of nodes in the tree. This happens when the tree is very unbalanced (a stick) so has depth $O(k \cdot n)$, and value is at the deepest node. (Alternatively, it is $O(k \cdot d)$ where d is the depth of the tree.)

Marking guide (2 marks): 1 mark for correct complexity (0.5 for missing the compare), 1 for mentioning unbalanced trees (or any tree, if depth).

QQ: 749389476

<https://tutorcs.com>

Question 18

Complete the tail-recursive function `sum_parents_tail`, which computes the same value as `sum_parents`

```
def sum_parents_tail(node, value):
    return sum_parents_tail_aux(node, value, 0)
def sum_parents_tail_aux(node, value, acc):
    if node is None:
        return #1
    elif node.item == value:
        return #2
    else:
        return #3
```

1. None
2. acc
3. return sum_parents_tail_aux(node.left if value < node.item else node.right, value, acc + node.item)

For #3, it is also acceptable to add a `if` statement, rather than a ternary, i.e.:

```
if value < node.item:
    return sum_parents_tail_aux(node.left, value, acc + node.item)
else:
    return sum_parents_tail_aux(node.right, value, acc + node.item)
```

Marking guide (5marks):

- 1 mark for None
- 1 mark for acc
- 1 mark for being correctly tail recursive, 1 mark for correct child, 1 for correct accumulator in call(s).
- -0.5 for missing return.
- -0.5 if the statement appears in wrong order, for example #2 written as an answer for #1.
- -0.5 if the condition is flipped, example (if value > node.item then go left) which should go right.

Heaps

Question 19

程序代写代做 CS编程辅导

This question is about heaps.

Consider an implementation of a `MaxHeap` which provides the following methods:

`__init__(self)`, which creates
`add(self, item)`, which adds a
`get_max(self)`, which removes the maximum value `item` from the Heap.

Write a function `find_kth_smallest` which returns the `kth` smallest item in array `alist` (with 1 being the smallest). You must start your implementation with the following line:

```
def
```

WeChat: cstutorcs

```
find_kth_smallest(alist, k):
```

```
    mx = MaxHeap()
    n = len(alist)
    # TODO
```

Assignment Project Exam Help

You cannot use any additional `MaxHeaps` or other data structures.

Email: tutormcs@163.com

```
find_kth_smallest(alist, k):
```

```
    index = n - k
```

```
    if(index < 0):
```

```
        raise IndexError("Tried to get the kth smallest in a list with fewer than k elements.")
```

QQ: 749389476

```
    for(item in alist):
```

```
        mx.add(item)
```

```
    for(_ in range(index)):
```

```
        mx.get_max()
```

```
    return mx.get_max()
```

https://tutorcs.com

Marking guide (8 marks):

- 1 mark for raising an exception on $k > n$.
- 2 marks for adding all items into the max heap
- 2 marks for removing some number of items from the heap
 - +2 for removing $(n-k)$, only +1 if some error (off by one, etc.)
- 1 for returning the last item

程序代写代做 CS编程辅导

It will print “a should be greater or equal to b”. The `mystery2(3, 4)` calls `mystery1(3, 4)`, and the `assert` statement fails. At that point, the assertion fails to the catch block in `mystery2`. The `AssertionError` matches the catch block, and the attached message is printed.

Marking guide (4 marks):

- 1 for ‘a should be greater or equal to b’
 - o 0 for saying it crashed
 - o 0.5 for referring to the correct error in `mystery1` but mistakenly using the wrong error message
- 1 for talking about the raised assertion
- 1 for talking about skipping the inner catch
 - o 0.5 for not explaining why the inner catch is skipped
 - o 0.5 for recognising inner catch can’t handle an assertion error (but thinking it crashes)
 - o 0 for not explicitly mentioning that it is skipped
- 1 for talking about matching the outer catch
 - o 0.5 for not specifying the exception in the outer catch
